Ques 1

Answer Business Intelligence (BI) refers to technologies, tools, and processes used to collect, analyze, and present business data to support strategic, tactical, and operational decision-making
Key components include data sources, ETL, data warehouse, analytics, and reporting tools.

Ques

Answer BI architecture consists of data sources, ETL processes, data warehouse, OLAP tools, and reporting/dash board tools;
Data is extracted, transformed, stored, analyzed and finally presented for decision-making.

Ques

Answer BI is used across marketing, finance, HR and operations to analyze performance, improve efficiency, and support informed decisions.
It helps organizations gain insights from large volumes of data.

Ques

Answer BI helps organizations gain competitive advantage through performance monitoring, forecasting, and trend analysis.
It enables faster and more accurate decision-making.

Ques

Answer BI can be integrated with existing systems using ETL tools and data warehouses.
Challenges include data quality and compatibility, which can be solved using standardization and data governance.

Ques

Answer BI fits into legacy system through data integration and ETL processes.
Data quality, system compatibility, and consistent data formats are critical for successful BI implementation

Ques

Answer BI aligns data analysis with business goals to improve performance and decision-making. For example, sales forecasting and customer analysis directly support strategic Planning.

Ques

Answer Traditional reporting is static and historical, while modern BI is dynamic, interactive, and real-time. BI improves decision-making efficiency through dashboards and analytics.

Ques

Answer Steps include data extraction from ERP/CRM, ETL processing, data warehousing, and reporting. Benefits include improved customer insights, better sales forecasting, and operational efficiency.
